

## **Member Company Support for CMDBf Standard for Federating Configuration Management Data**

### **CA:**

"CA is proud to have helped the development of a new standard for interoperable, federated CMDB that will present a single unified query and data access capability from multiple management data providers," said Paul Lipton, vice president of industry standards and open source at CA. "CMDBf extends the value of CA solutions based on CMDB, providing our customers improved quantity of quality of data, reduced cost, and better alignment with industry best practices like COBIT and ITIL."

### **Fujitsu:**

"Fujitsu welcomes the release of the CMDBf standard for federating system management data as a solution that enables simple and efficient interoperable operation and management of systems. Fujitsu has been an active contributor to DMTF standardization activities from the start, by collaborating with multiple vendors for specification development and standardization," said Masato Nitta, president, middleware business unit, Fujitsu Limited. "Adoption of the CMDBf standard will make multi-vendor interoperability possible, thus enabling integrated IT system management by customers. We will proceed with efforts to apply the standard to Fujitsu products and continue with product development to offer greater convenience to our customers."

### **HP:**

"Publication of the CMDB Federation 1.0 specification allows customers to make more informed business decisions by accessing CMDBs and management data repositories that interoperate across multiple vendor offerings," said Jamie Erbes, vice president and chief technology officer, software & solutions, HP. "We look forward to working towards broadening the applicability and appeal of this and related future specifications."

### **Hitachi:**

"Hitachi is very pleased with the completion of the DMTF CMDBf standard that enables companies to more effectively manage their entire IT environment in complex, multi-vendor infrastructures," said Hideaki Sakaue, executive general manager, software division, Hitachi, Ltd. "We plan to support the CMDBf standard in future product offerings of Hitachi's system management software and are committed to continuing our contributions to the development of this standard."

### **IBM:**

"IBM helps organizations to align and automate their IT infrastructures and streamline business operations to enhance business performance," said Matt Ellis, vice president of autonomic computing, IBM. "CMDBf simplifies management system integration by facilitating direct access to data sources. CMDBf allows our clients to easily build their

dynamic infrastructures using a federated CMDB and MDR ecosystem without having to migrate all their management data into one centralized repository."

**Microsoft:**

"The ability to exchange data between the various CMDBs implemented within the industry is important in ensuring that customers with heterogeneous environments have the ability to effectively manage across them to reduce complexity and costs," said Larry Orecklin, general manager, system center and virtualization at **Microsoft**. "Microsoft is pleased to have worked with the DMTF and the participating companies during the standardization process for CMDBf and to see the release of the standard."

**Novell:**

"Today's data centers are heterogeneous environments with multiple masters and stakeholders, but in order for any organization to make decisions or analyze business performance these mixed environments need to work together simply and seamlessly," said Alan Murray, vice president of product management at Novell. "Novell is a strong supporter of the Configuration Management Database Federation (CMDBf) standard, because it facilitates the interoperability of data from multiple points of view. With a comprehensive view of the entire IT environment, administrators can utilize configuration data to streamline management tasks resolve issues and most importantly effectively manage the components in their IT infrastructure."

**BMC Software:**

"BMC is proud to have taken a lead role in developing these standards which are critical to ensuring the widespread and successful adoption of configuration management," said Gerry Roy, director of solutions management at BMC Software. "These standards can help organizations lower costs by making better use of their existing investments, reduce risk associated with unmanaged configuration change and effectively prioritize efforts according to greatest business impact."

**Cisco:**

"As customers are virtualizing their data centers, they are more receptive than ever to technologies that simplify operations," said Guy Daley, director of product management for **Cisco's** Network Management Technology Group. "The CMDBf standard offers potential for customers and vendors alike, as it promises to reduce over time the number of required databases and vendor-specific interfaces in multivendor systems-management environments."
